

Overview

Developed for professional hosting service providers, Plesk is comprehensive server management software designed to install and manage all systems and applications for hosting on a single server. Created to empower growth and allow Sys Admins to manage up to thousands of virtual hosts on a single machine. Plesk eliminates constraints to increasing per server profitability.

Plesk provides the perfect solution for service providers to increase clientele and customize their systems to meet the growing needs for self administration by their customers.

There are four login levels in Plesk with each level having its appropriate roles and responsibilities:

Administrator – The highest individual server level login which enables hosting administrators to quickly and easily set up and manage all system items. Multiple servers can be centrally managed with the Master level login of Plesk Expand.

Client/Reseller – Second tier login account where the users are given domain creation rights from the System Administrator. Clients can powerfully administer groups of domains using a single login.

Domain Owner – Third tier for individual domain owner accounts with predetermined permission sets and interfaces for single domain administration.

Mail User – Individual mail account level which enables the user to log in to their own private interface to manage passwords, spam filters, anti-virus settings and much more.

“ Plesk has been a key part of EV1's hosting offerings since 2001. We have selected Plesk as our control panel of choice because it's a dependable product that has all of the innovative features and ease-of-use we look for in a control panel. Our long-term relationship with SWsoft has not only benefited our customers but also lowered EV1Servers' total support costs. ”

Robert Marsh, CEO and Head Surfer of EV1Servers

Innovative Ease of Use

Plesk has a redesigned cleaner and easier to use interface. Plesk comes with many additional skins and conveniently gives users the ability to design custom skins and manage them in the browser-based interface.

Highest Stability

Plesk has been specifically designed to be the most stable and secure control panel available. Plesk has been proven under fire managing over 5 million plus domains globally and can reliably support up to thousands of accounts per server for increased profitability.

Most Secure

Not only does Plesk contain new security features but existing security features have also been improved. The software's redesigned subsystem improves overall system security as well as support for 3rd party FTP servers that make secure uploads possible.

Comprehensive

Plesk users will benefit from a new level of integration with other SWsoft products, including Virtuozzo, HSPcomplete, SiteBuilder and PEM. The completely customizable "Application Vault" can manage dozens of integrated applications including Ecommerce, Chat, Bulletin Board and numerous others.

Fully Automated

With Plesk for Windows and Plesk for Linux/UNIX, reload your control panel and keep it reloaded. With 100+ recent enhancements, the software delivers a further ease of management through features like key auto-update, auto-component updater, migration manager, and a Web-based installation for quick deployment and reduced need for support.

Extensive Platform Support

Plesk for Linux/UNIX and Plesk for Windows now have many common features, skins, application packs, language packs and documentation. Operating systems supported include RedHat, SuSE, Fedora Core, FreeBSD, CentOS, Debian and Windows.

For Shared Hosting

Plesk's tiered self-administration and uniform multi-platform design is perfect for the management of a shared hosting environment. The software empowers providers to manage thousands of domains running reliably on highly scalable architecture optimized for the reseller channel. Non-technical staff can easily create, setup, and manage accounts while customers self-administer their virtual domains without technical support. Plesk is the solution that meets both simple and complex hosting system configuration needs while allowing complete customization for clear differentiation while reducing costs.

For Virtual Hosting

Plesk delivers management power in a small footprint making it an ideal solution for Virtual Private Server hosting. Using Virtuozzo and Plesk, users can deploy templates of Plesk systems in seconds while offering the complete isolation of a dedicated server. Point and click the upgrade of hundreds of Plesk servers from a single VPS console in minutes. Drag and Drop entire systems to new servers in seconds with little to no downtime. Plesk and Virtuozzo™ are unsurpassed in their ability to increase ROI and generate revenue for the professional web hosting provider.

For Dedicated Hosting

Plesk's RPM installation and modular design allow Dedicated Hosting providers to meet the needs of tech savvy customers. Plesk deploys in minutes to quickly provide a high performance solution that is comprehensive yet inexpensive. The software provides several unique tools including a full XML API for automating the provisioning process and integrating 3rd party applications. A complete Software Development Kit (SDK) with multiple backend utilities delivers to service providers and their customers more power to customize their offerings as well as an avenue for easy up-selling and increased customer attraction and retention.
